

REPAIRING Wood Windows

Historic windows make a significant contribution to a building's facade and interior character, and are important features of the overall streetscape within historic neighborhoods. Existing window sash and frames should therefore be repaired where possible. Unlike today's metals replacement windows, earlier wood units are constructed such that damaged portions may be repaired or replaced one part at a time. This approach results in savings over time for the building owner and insures that historic material will be retained to the greatest degree possible.

"Dutchman" or splicing repairs, which replace only the damaged portion of a single component with material matching the original in all profiles and visual qualities, are recommended.

EPOXY CONSOLIDATION

Rotted wood components can often be repaired through epoxy consolidation. Epoxies are two-part compounds which protect wood fibers from additional moisture damage and provide a smooth, paintable surface. This is in some instances more cost effective than the labor-intensive splicing technique. You should specify only top-quality consolidation and patching materials specially formulated for wood (rather than metal cars or fiberglass boats).

DOCUMENTATION

Occasionally deterioration is so advanced or extensive that replacement of the entire component (stile, rail, parting bead, etc.) with new matching material is warranted. Required replacements should match the originals in material, finish, configuration, and all sizes, shapes, profiles, and visual qualities. Conditions of deterioration beyond repair should be conclusively documented photographically. Additionally, where extensive replacement of sash and/or frames is proposed, a comprehensive existing-condition window survey specifying existing conditions for frame, sash, glazing, and hardware components may be required before review can be completed.

HISTORIC METAL WINDOWS

A Preservation Brief describing techniques for repairing historic metal windows is available upon request from this office.

ENERGY CONCERNS

Repairable windows should never be replaced with new units as a Weatherization measure. Alternatives to window replacement which

increase the energy efficiency of the overall building envelope are generally less costly and should be explored. These include: additional glazing through retrofitting or storms; extra attic and ceiling insulation; caulking; quality weatherstripping. Our FYI publications 'Retrofitting Historic Windows'1 and 'Insulation'11 provide additional guidance.

ADDITIONAL INFORMATION REQUEST

If repair of existing sash and frames cannot occur, please specify or provide:

1. Conclusive photographic documentation of deterioration beyond repair.
2. Comprehensive existing-condition window survey detailing frame, sill, and all sash components.
3. Head, jamb, and sash section drawings for existing and proposed new window units.
4. Life-cycle cost estimates for repair; replacement in-kind; all other options explored.
5. R-value estimates for repair and energy retrofit options vs all others, estimate pay-back period for each option.
